

MailHog + osTicket Integration — Screenshot Log

HOMELAB.LOCAL | SOC & IT Operations

1. Confirm MailHog Container Is Running

Ran **docker ps** on SRV01-UBT24 to confirm the MailHog container was active, with ports 1025 (SMTP) and 8025 (web UI) mapped to the host.

```
SRV01-UBT24 (OSTicket Installed) [Running] - Oracle VirtualBox
File Machine View Input Devices Help
Activities Terminal Aug 4 18:10
homelab-linux-admin@SRV01-UBT24: /home
homelab-linux-admin@SRV01-UBT24:/home$ docker ps
permission denied while trying to connect to the docker API at unix:///var/run/docker.sock
homelab-linux-admin@SRV01-UBT24:/home$ sudo docker ps
[sudo] password for homelab-linux-admin:
CONTAINER ID   IMAGE          COMMAND                  CREATED        STATUS        PORTS
NAMES
9031e31b66a0   mailhog/mailhog "MailHog"               43 hours ago   Up 2 hours    0.0.0.0:1025->1025/tcp,
[::]:1025->1025/tcp, 0.0.0.0:8025->8025/tcp, [::]:8025->8025/tcp   mailhog
homelab-linux-admin@SRV01-UBT24:/home$
```

2. Configure osTicket Outgoing SMTP Settings

In the osTicket Admin Panel, opened the default Support email's Outgoing (SMTP) tab and set Status: Enable, Hostname: 10.0.2.102, Port: 1025, Authentication: None.

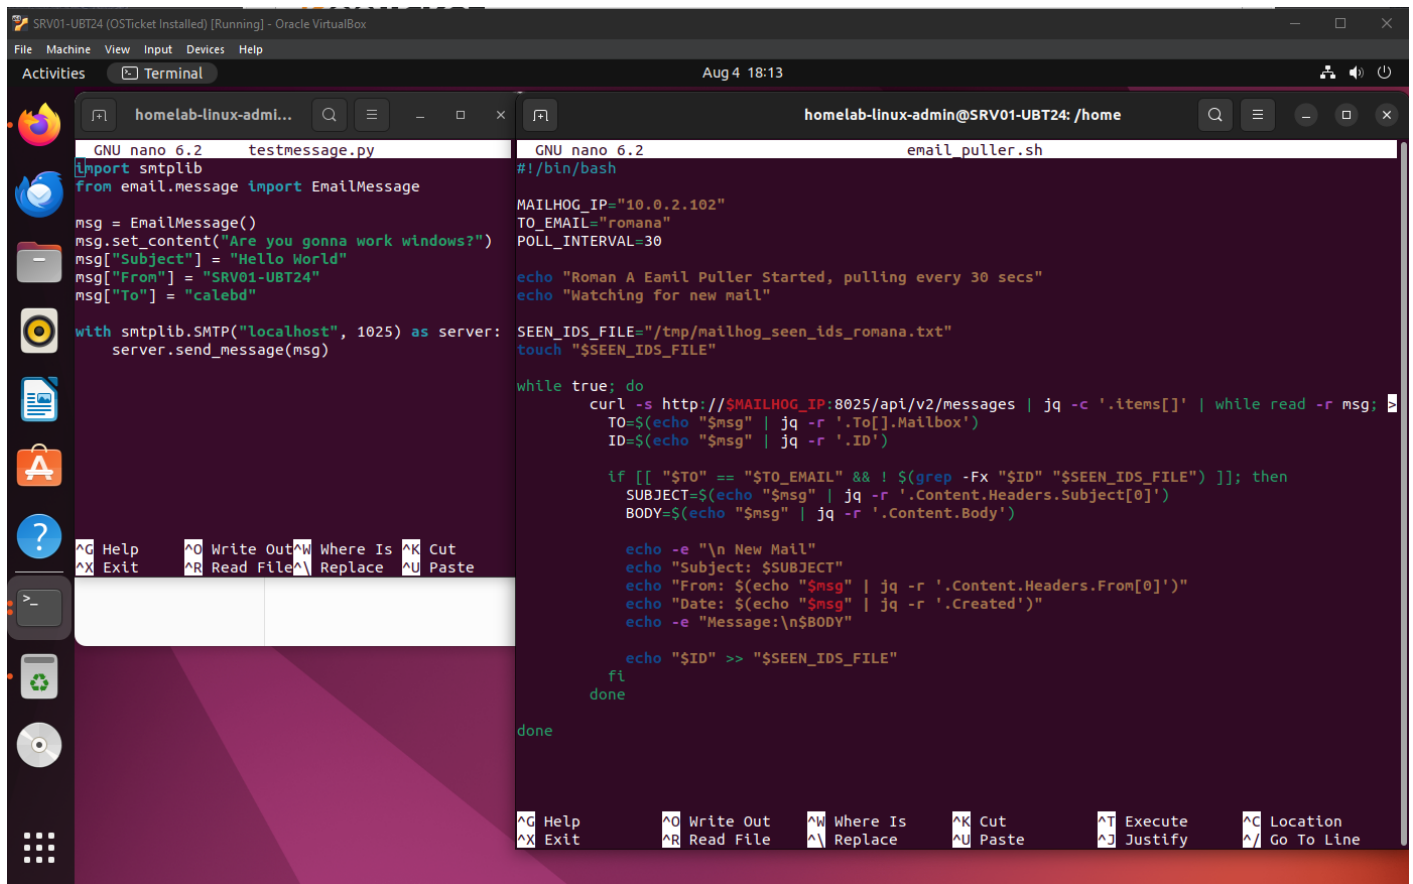

The screenshot shows a web browser window with the osTicket Admin Control Panel. The address bar shows the URL `10.0.2.102/osticket/scp/emails.php?id=1#smtp`. A yellow warning banner at the top states: "Click to go back (Alt+Left arrow), hold to see history directory (../setup/) for security reasons." The page header includes the osTicket logo and a welcome message for "Mike" with links to "Agent Panel", "Profile", and "Log Out". The navigation menu includes "Dashboard", "Settings", "Manage", "Emails", and "Agents". The "Emails" section is active, showing a list of email accounts: "Emails", "Settings", "Banlist", "Templates", and "Diagnostic". The "Emails" tab is selected, showing the "Support <mayberry-admin@homelab.com>" email account. The "Outgoing (SMTP)" tab is selected, displaying the "SMTP Settings" form. The form includes the following fields and options:

- Status: ☒ Enable ☐ Disable
- Hostname:
- Port Number:
- Authentication:
- Header Spoofing: ☐ Allow for this email

At the bottom of the form are three buttons: "Save Changes", "Reset", and "Cancel". The footer of the page states: "Copyright © 2006-2026 MikeMayberry All Rights Reserved." The Windows taskbar at the bottom shows the time as 6:11 PM on 8/4/2026.

3. Test Scripts — Direct SMTP Test and Mail Puller

Left: a Python smtplib script used to send a test message directly to MailHog on port 1025, isolating MailHog from osTicket for testing. Right: an email_puller.sh script that polls MailHog's API for new mail matching a target recipient.

The screenshot shows a terminal window with two panes. The left pane displays the Python script `testmessage.py` using `smtplib` to send an email. The right pane displays the shell script `email_puller.sh` which polls MailHog's API for new messages.

```
GNU nano 6.2 testmessage.py
import smtplib
from email.message import EmailMessage

msg = EmailMessage()
msg.set_content("Are you gonna work windows?")
msg["Subject"] = "Hello World"
msg["From"] = "SRV01-UBT24"
msg["To"] = "calebd"

with smtplib.SMTP("localhost", 1025) as server:
    server.send_message(msg)
```

```
GNU nano 6.2 email_puller.sh
#!/bin/bash

MAILHOG_IP="10.0.2.102"
TO_EMAIL="romana"
POLL_INTERVAL=30

echo "Roman A Email Puller Started, pulling every 30 secs"
echo "Matching for new mail"

SEEN_IDS_FILE="/tmp/mailhog_seen_ids_romana.txt"
touch "$SEEN_IDS_FILE"

while true; do
    curl -s http://$MAILHOG_IP:8025/api/v2/messages | jq -c '.items[]' | while read -r msg; do
        TO=$(echo "$msg" | jq -r '.To[]Mailbox')
        ID=$(echo "$msg" | jq -r '.ID')

        if [[ "$TO" == "$TO_EMAIL" && ! $(grep -Fx "$ID" "$SEEN_IDS_FILE") ]]; then
            SUBJECT=$(echo "$msg" | jq -r '.Content.Headers.Subject[0]')
            BODY=$(echo "$msg" | jq -r '.Content.Body')

            echo -e "\n New Mail"
            echo "Subject: $SUBJECT"
            echo "From: $(echo "$msg" | jq -r '.Content.Headers.From[0]')"
            echo "Date: $(echo "$msg" | jq -r '.Created')"
            echo -e "Message:\n$BODY"

            echo "$ID" >> "$SEEN_IDS_FILE"
        fi
    done
done
```

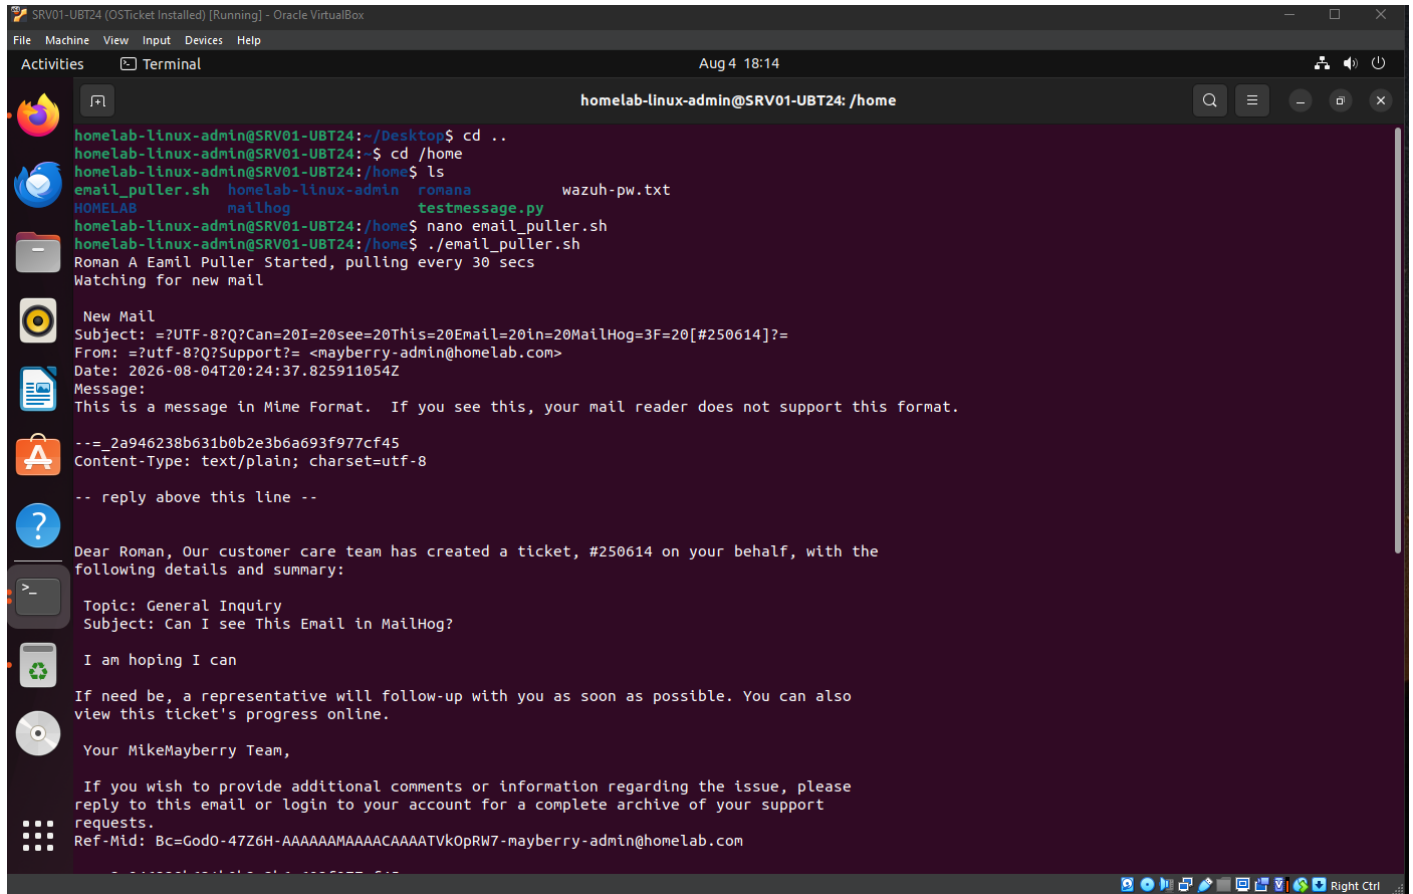

4. MailHog Web UI Showing Captured Mail

MailHog's web interface at localhost:8025, showing two captured messages — a manual test message and a real osTicket-generated 'New Ticket Alert' notification.

5. Mail Puller Script Output

Terminal output of email_puller.sh detecting and displaying a new message pulled from MailHog, including the full osTicket auto-reply confirming ticket #250614 was created.

-- reply above this line --

Dear Roman, Our customer care team has created a ticket, #250614 on your behalf, with the
following details and summary:

Topic: General Inquiry
Subject: Can I see This Email in MailHog?

I am hoping I can

If need be, a representative will follow-up with you as soon as possible. You can also
view this ticket's progress online.

Your MikeMayberry Team,

If you wish to provide additional comments or information regarding the issue, please
reply to this email or login to your account for a complete archive of your support
requests.
